Understanding Photoshop layers Photoshop layers enable you to place layers on top of each other and also duplicate layers. The different layers let you paint, draw, or paint over the layers. You can also merge, dissolve, and fade layers. Photoshop uses layers to compose, assemble, and edit an image. When you're editing an image in Photoshop, you create a new layer and then place an object on the image, like the text you've created on the background. You can duplicate the layer, place it in a different position, and continue to edit and add objects until the image is complete. Figure 3-1 shows some of the layers in a photograph. FIGURE 3-1: You add and remove layers from your images as necessary to manipulate the appearance and content of the photo. Photoshop has many different kinds of layers: * **Content layers** are transparent layers that allow you to manipulate the image's content. You can add and remove different parts of a layer. * **Mask layers** are opaque layers that you use to mask a portion of an image or other layer. * **Paths** are layers that serve as guides that you draw directly into a photo. * **Frames** are solid color sections that you position to frame a photo. You can create a series of frames as a montage or a border.

Autosomal dominant polycystic kidney disease associated with pheochromocytoma and giant splenomegaly in a Japanese family. We report an autosomal dominant polycystic kidney disease (ADPKD) family with two of its members affected with pheochromocytoma, one of whom had giant splenomegaly. The clinical course of the disease in the male patient, who had giant splenomegaly, suggested that he was affected with an early form of ADPKD. The prevalence of the disease in the family was 4 out of 10.8 family members (2/9 male and 2/9 female). The size of both the kidneys and the liver were normal in members having ADPKD. These findings indicate that ADPKD may sometimes cause pheochromocytoma, and that pheochromocytoma may be a cause of giant splenomegaly.

Q: How do I set an inline style to an SVG? I'm trying to change the bottom property of an svg object, but can't figure out why the object is ignored. I've tried setting the height/margin properties on the svg to *height and *margin on the svg tag, but then the svg object itself doesn't work.

```
function showFunc() { console.log(this.id); }
document.getElementById("box").addEventListener("click", showFunc);
```

#box { margin-top: 50px; }

A: You can use the id of the node or the class for the height/margin property.

```
function showFunc() { console.log(this.id); }
```

Q: How do I inject a certain variable into a Razor Partial View? I have a @Model.X variable that I want to inject into all instances of a Razor Partial View. I tried to do this in my main View like this: @Html.Partial("Contact", Model.X) but it didn't work.

A: You can pass values to partial view using session variable first write a controller and set value to session variable

```
public class HomeController : Controller {
    public ActionResult Index() {
        Session["foo"] = "Bar";
        return View();
    }
    [HttpGet]
    public ActionResult Index() {
        return View("~/Views/Partial/Index.cshtml", "foo");
    }
}
```

Then in partial view, use session variable like this

```
@Model.X @ {
    var foo = HttpContext.Session["foo"];
}
```

The Downy Mildew of Nightshades (Nicotiana) and the Origin of Tobacco Vein Yellowing. There have been recurrent episodes of nightshade (Nicotiana) leaf yellowing in North American nightshade (Nicotiana) cultivation throughout the 20th century. In this study, the objective was to determine whether there is a single, genetically controlled mechanism responsible for the occurrence of yellow leaf color in nightshades. The objective was addressed through a rigorous investigation of the genetic, environmental, and chemical influences on the development of the phyllody (disease) in Nicotiana glutinosa cultivars 'Jalapa', 'Trident', and 'Nicodemus'. In a greenhouse experiment, 'Jalapa', 'Nicodemus', and 'Trident' plants were grown in a naturally infected field with the downy mildew (DM) fungus. DM-infected plants and uninfected control plants were grown in an environment with increasing light intensity levels (LLs) at the time of inoculation to generate a range of DM susceptibility. DM-infected plants were monitored daily for 10 mo to record first- or second-generation symptoms. DM-infected plants with continuous symptoms were
