Novel strontium-calcium glass with good biocompatibility and osteoconductivity for the treatment of bone defect. In order to overcome the drawbacks of the currently available bone substitute materials, a new strontium-calcium glass (Sr2-3Ca) was designed. The biocompatibility of this material and its osteoconductivity were investigated by measuring the alkaline phosphatase activity of the human osteoblast-like MG63 cells cultured on both the glass and poly(methylmethacrylate) (PMMA) plates. The results obtained showed that this glass is safer and more biocompatible than PMMA and can promote the formation of new bone tissues on its surface. The alkaline phosphatase activity was assayed by a chromogenic substrate method for about 7 days. The results showed that the activity of osteoblasts on the glass substrate was significantly higher than that on the PMMA plate.Q: Strange behaviour in ColdFusion when using "for
