Dosing frequency in the management of hypertension. The effects of diuretic and beta-adrenoceptor blocking drugs on cardiovascular complications have been established, and their effects on morbidity and mortality are clear. It appears that low-dose diuretics are as effective and well tolerated as high-dose ones. Yet, low-dose diuretics are still a common practice. Often, dosage of diuretics is not mentioned and the dosing frequency is not specified. Studies of dose-response relations for most antihypertensive drugs, however, suggest that there is an optimal dose for each drug, with no adverse effects when doses are too high. The risk of adverse effects will increase at too-low doses of diuretics and beta-blockers. In addition, there is sufficient data to support the use of extended-release forms of some drugs. It is difficult to justify the use of a placebo when the risks of hypertension are so high and when the benefits of antihypertensive drugs have been proven. Use of an extended-release form of a drug is not equivalent to increased frequency of intake or dosage. The long-term cardiovascular effects of too-high doses

of antihypertensive drugs are not well documented. Diuretic therapy should be used to reduce excess salt and water and because it is inexpensive and effective. The primary goal of antihypertensive therapy is to reduce left ventricular hypertrophy and to prevent stroke. To do this, the drug should be effective in the treatment of hypertensive patients and should be well tolerated. Furthermore, it should have a long half-life so that the combination of drugs necessary for converting mild to moderate essential hypertension can be avoided.⁴

===== In this paper, we present a method for addressing the handling of large amounts of discrete data stored in a distributed computing environment. We defined a model that emulates the main features of the system and a methodology for applying such a model. We also presented an architecture that extracts relations between data and functions from large amounts of data. This architecture relies on a platform dedicated to data management. The information management system for discrete data (Indi e24f408de9
