
Download Java Mc Application Mobile Phone

Netbeans is ideal for developing J2ME mobile applications A year ago, I developed a simple j2me application in netbeans 8.3. This application has been developed for Android. I have been using netbeans to develop j2me applications, but recently I decided to get into android application development as well as create a Java user interface for them. I know Netbeans 8.3 is compatible with Java 8. Now I'm wondering if Netbeans 8 will work in Android. Can someone please provide me with any information on what I can do to use Netbeans 8 in Android? Thank you
