Templates Templates are data objects that facilitate repetitive drawing tasks. Templates are used for pre-defined layouts, utilities, components, and symbols. A template is a data structure that consists of several or more layers, and a drawing may contain any number of template layers. Templates can contain entire blocks, or individual objects that are displayed together on the screen. Using the ribbon, one can easily select a template, then drag-and-drop it into a drawing. Once inserted, the template appears on the drawing, or in the edit menu. Objects are selected by placing the cursor on them, using the techniques discussed earlier. This is known as the "drag and drop" feature. In addition, templates may contain object properties, such as a caption, color, linetype, lineweight, or text, to display on the template. Templates can be used to automate routine work, such as the creation of parts, assembly instructions, or product drawings. Each template is called a "recipe" and can contain a certain number of drawing layers and blocks. Every block is independent and can contain any number of objects. The insertion of an entire layer and its blocks is known as a "recipe" and may be called a "template". A template can contain any number of drawing layers and blocks. In this sense, the term "template" means not only a drawing but also a recipe. Templates may have their own properties, which are not the same as those of objects, and are displayed on the drawing's own layout. To insert a template, select Insert→Utility→Template from the ribbon. If the template is not already present, a template definition is created and inserted into the drawing. Help AutoCAD's help system is a text-based help system. It is available at any time by pressing the F1 key. The help system consists of a vast number of sections that cover all of the drawing and menu commands, their parameters, and how they work. The user can either find the information on-line by using the help browser, or print a manual. The online help system contains sections for all types of commands, their parameters, their behaviour, and their usage. The online help system is designed to be quick and efficient and to be easily accessible. To use it, the user simply presses F1 and navigates through the tabs. A map and the list of tabs in the table of contents are shown. Each help page shows 5b5f913d15
