Photoshop has a very robust program option that allows you to tweak, retouch, color correct, and re-create images in all kinds of ways. The program also features drawing tools, color correction, adjustment layers, filters, layer masks, UV channels, editing brush controls, soft edges, 3-D effects, transparencies, and predefined content-aware fill. Photoshop is a powerful tool for image retouching, although it does have limitations. Many people have reported that Photoshop can't accomplish certain things, such as making it so that an image is watermarked, or even creating realistic-looking clouds in a sky. Photoshop also has limitations in some of its product options, such as lack of content-aware fill, although the software has been improving in this area. If the image contains an active layer, first deselect that layer or make it inactive. 3. Choose Layer ⇨ New Layer. 4. Name the layer Photo. 5. Fill the layer with black, as shown in Figure 12-2. **Figure 12-2:** Fill the black layer you create with the image. 6. Save the image as a JPEG. You can create a watermark right in the image that you open in Photoshop. If you don't want to create a watermark in Photoshop itself, you can then create a vector image. You can even add the image to a layout at this point, although the image won't show up properly unless it's in a state of being transparent and not filled. 7. 1. Field of the Invention The present invention relates to a contactor device for controlling a drive motor by switching the contact between a low-resistance connection at a terminal of the contactor device and a high-resistance connection at a terminal of the contactor device. 2. Description of the Related Art A drive motor, such as a rotation motor, is disposed in a car or the like and has a brush, which is drawn out from a connector mounted on the drive motor, that is connected with a low-resistance lead of the drive motor, and a brush, which is drawn out from a connector mounted on the drive motor, that is connected with a high-resistance lead of the drive motor. Such a brush is referred to as a "high-resistance contact" and a "low-resistance contact". In this arrangement, the brush that is connected with the high-resistance lead of the drive motor is set to be in contact with the low-resistance lead. When the drive motor is operated, a current flows through the brush that is connected with the high-resistance lead. However, since the current is limited by a contact resistance in the brush that is connected with the low-resistance lead, the current flows through the brush that is connected with the low-resistance lead. As a result, the brush can be continuously driven and the drive motor can be continuously operated. Here, a contactor device for switching the contact between the brush that is connected with the high-resistance lead and the brush that is connected with the low-resistance lead is provided on the connector, as disclosed in Japanese Unexamined Patent Application Publication No. 2013-176774, for example. In the contactor device disclosed in Japanese Unexamined Patent Application Publication No. 2013-176774, it is possible to control a high-resistance contact and a low-resistance contact and a drive motor and even a relay (contactor) simultaneously by a single operating device. Furthermore, Japanese Unexamined Patent Application Publication No. 2014-71187 discloses a contactor device that is capable of switching the contact between a high-resistance lead and a low-resistance lead for a switch-on/switch-off control. However, in the contactor devices disclosed in Japanese Unexamined Patent Application Publications No. 2013-176774 and No. 2014-711
