Category:AutocadThe Milky Way's arm: A new path to the hidden universe Astronomers have recently discovered that the Milky Way galaxy has at least one known arm, in addition to the well known two arms. This discovery was made using a European satellite called Planck, which looks at the cosmic microwave background, or the left-over radiation from the Big Bang. Planck has been observing and analyzing the cosmic microwave background since it launched in May 2009. The satellite passed over the southern Atlantic on September 15, 2014 and spent about a month scanning the region. The researchers only recently released the full data set but it is important information for both astronomers and cosmologists. Cosmologists are concerned with how the universe began and how it evolved, while astronomers are keen to discover more about our cosmic neighbors. The observations from Planck were made over a range of wavelengths, from radio waves to microwave light. Since the cosmic microwave background is hot, Planck was able to measure the amount of material that blocked the light, thus allowing the number of galaxies to be determined. This method is used to determine the distribution of mass in the universe. Gravity is a force that shapes the universe and the Milky Way galaxy. This force stretches the galaxies into long thin tails that make up the cosmic web. While the universe's web is visible in red light, we have no way of seeing the web in ultraviolet light, making a hidden part of the universe known as the "baryon" universe. This component of the universe has been referred to as dark matter because it does not emit any light. At the same time, the baryon universe is visible as glowing clusters in the visible and ultraviolet spectrum, and it is thought to be invisible in infrared light. Planck can detect these glow and dark particles, but the satellite can only detect one side of the web. "Planck is the only satellite that can see both sides of the cosmic web," said Planck project scientist Dr.
