Conventional wave guides are generally manufactured from conductive materials such as metal (e.g., copper, aluminum, silver, gold, and the like) or from polymers that are impregnated with conductive fillers (e.g., carbon particles, carbon fibers, or the like). Such conventional wave guides may be used for channeling electromagnetic waves (EM waves). A resonator that uses a conventional wave guide is referred to as a conventional wave guide-type resonator. Stray capacitance and inductance of the conventional wave guide may cause non-linearity, for example, in the band-pass characteristic. One example of a conventional resonator is shown in FIG. 8A. FIG. 8A is a cross-sectional schematic diagram of a conventional resonator 800. In the conventional resonator 800, a surface 813 of a wave guide 801 is rough due to the unevenness of the surface and has an uneven surface structure. Thus, the electric field formed on the surface 813 of the wave guide 801 is uneven, and the uneven electric field may be applied to a surface 812 of a dielectric block 810. The uneven electric field may result in variations in the effective permittivity of the surface 6d1f23a050
